

Environmental Health

ABOUT THE COVER

Approximately 11% of foodborne outbreaks caused by *Clostridium perfringens* occur in correctional facilities. This month's cover article investigates

an outbreak caused by *C. perfringens* infection and intoxication at a county correctional facility. Based on estimates and projection calculations, the outbreak sickened 250–666 inmates. While four different food items—chicken taco meat mixture, cheese sauce, rice, and beans—tested positive for *C. perfringens* enterotoxin, outbreak investigation findings point to the chicken taco meat mixture as the culprit.
